

Effects of Combat Study

Category

PTSD/TBI

Enrollment Closing Date

September 20, 2024

Description

This study investigates current and former U.S. military persons with combat exposure, including those exposed and unexposed to mild traumatic brain injuries (mTBI). The study involves an MRI brain scan and assessments of your thinking and mood. Your initial participation will take approximately 8 hours over the course of two visits. The study will also periodically conduct in-person and telephone reassessment in subsequent years. Info: www.limbic-cenc.org.

Requirements

- *Veterans and Service Members, with a history of combat exposure
- *MRI safe (no metal inside the body)

Benefits

Your participation may help researchers and clinicians better understand outcomes of those exposed to combat, both exposed and unexposed to mTBI.
